NEW QUESTION: 1

Scenario: A network engineer is configuring a new router (R2) to connect to an existing network. The existing network has a loopback address of 10.89.0.0/24. The new router (R2) has a loopback address of 10.89.16.1. The engineer wants to ensure that traffic from the existing network can reach the new router and vice versa.

- A. router2(config)#ip route 10.89.3.0 255.255.0.0 10.89.16.2
- B. router2(config)#ip route 0.0.0.0 0.0.0.0 10.89.16.1
- C. router1(config)#ip route 10.89.0.0 255.255.240.0 10.89.16.1
- D. router1(config)#ip route 10.89.0.0 255.255.240.0 10.89.16.2

Answer: B

Explanation:

The fourth command makes it possible for all hosts beyond R2 and all hosts beyond R1 to interact with each other, hence it is the most simplest technique.

NEW QUESTION: 4

Which action will cause a currently in-sync SnapMirror relationship to fail out of sync?

- A. Modifying the /etc/snapmirror.conf file for the relationship on the destination storage system.
- B. Modifying the /etc/snapmirror.conf file for the relationship on the source storage system
- C. Running snapmirror release on the source storage system.
- D. Running snapmirror update on the source storage system.

Answer: A

Explanation:

https://library.netapp.com/ecmdocs/ECMP1196979/html/man1/na_snapmirror.1.html

https://library.netapp.com/ecmdocs/ECMP1196979/html/man5/na_snapmirror.conf.5.html

```
snapmirror update [ -S source ] [ -k kilobytes ] [ -s src_snap ] [ -c
```

```
create_dest_snap ] [ -w ] destination
```

For asynchronous mirrors, an update is immediately started from the source to the destination to

update the mirror with the contents of the source.

For synchronous mirrors, a snapshot is created on the source volume which becomes visible to

clients of the destination volume.

The snapmirror update command must be issued on the destination filer.

```
snapmirror release source { filer:volume | filer:qtree }
```

Tell SnapMirror that a certain direct mirror is no longer going to request updates.

If a certain destination is no longer going to request updates, you must tell SnapMirror so that it

will no longer retain a snapshot for that destination. This

command will remove snapshots that are no longer needed for replication to that destination, and can be used to clean up SnapMirror-created snapshots after snapmirror break is issued on the destination side.

The source argument is the source volume or qtree that the destination is to be released from. The destination argument should be either the destination filer and destination volume name or the destination filer and destination qtree path. You can use a line from the output of the snapmirror destinations command as the set of arguments to this command. The /etc/snapmirror.conf file exists on the node containing the mirror used for SnapMirror.
